

WINTERIZING KIT INSTRUCTIONS

Includes **FREE Winter Sorb™**
Stops Grease, Grime and Waterline Scum.
Now Included to Make Spring Startup Even Easier!

IMPORTANT! PLEASE READ ALL DIRECTIONS CAREFULLY BEFORE USING THE KIT.

1. Before winterizing your pool, balance the water and clear the pool of all algae growth, dirt, and leaves.
2. Circulate pool water during winterizing, and begin when pool water temperature maintains 65° F (or below).
3. Add contents of the 1 lb. bag(s) of **Chlorine-Free Shock** around the perimeter of the pool to oxidize contaminants from the water. Wait 30 minutes and proceed.
4. Pour entire bottle of **Winterizer** around the perimeter of the pool, making sure the product is evenly distributed.
5. Pour entire bottle of **Winter Stain-Away** around the perimeter of the pool, making sure the product is evenly distributed.
6. Continue filtering for at least an hour to disperse treatment uniformly throughout the pool.
7. Lower the pool water approximately 4" below the skimmer.
8. Drain water from plumbing lines, filter, and heater according to manufacturer's instructions.
9. Add **In The Swim Non-Toxic Anti-Freeze** (purchased separately) to all plumbing and equipment as recommended by the manufacturer.
10. **ADDING THE TIME-RELEASE WINTERIZING ENHANCER FLOATER**
 - A. Using a thick screwdriver or drill bit, carefully punch through all indents on both sides of the cylinder, up to your pool size, to allow water to enter and exit.
 - B. Place floater into pool so that the smaller diameter portion of the cylinder with the holes is submerged in water. **DO NOT THROW FLOATER INTO POOL!**
11. Place the **Winter Sorb™** into the pool, and allow to float free. It will absorb up to 40 times its weight in residual suntan oils, body oils, grime, and scum all winter season, and freezing will not hurt the material. **Winter Sorb™** works with your winter chemicals to give you a cleaner pool in the spring.
12. Cover the pool. For mesh or safety covers, we recommend adding an additional bottle of **Winterizer** (purchased separately) in early March.
13. If winter and/or spring are unusually warm, lift one end of the cover to check condition of water. If algae is present, add another bottle of **Winterizer** (purchased separately).
14. In the spring, remove cover, reconnect all plumbing, and raise water to proper operation level. Remove and dispose of time-release floater. This kit will be effective until water temperature reaches 65° F in the spring. At that time, begin regular in-season pool care program with an **In The Swim Start-up Kit**.

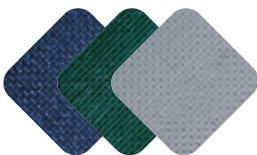

POOL CLOSING MUST-HAVES

POOL SHOCK
Sanitize your pool

pH INCREASER
Correct your water balance

WINTER COVERS
Protect your pool

WINTERPILL
Ensure an easier pool opening

CLOSING ACCESSORIES
Simplify your pool closing
